

L1 CUSTOMER SUPPORT TICKETING & CHAT SYSTEM

ABSTRACT

The L1 Customer Support Ticketing & Chat System is a web-based helpdesk application designed to provide an efficient and structured way for customers to report their issues and communicate with support agents. The system allows customers to register, log in, and create support tickets by entering issue details such as subject, description, and category, along with uploading relevant screenshots for better understanding of the problem.

Once a ticket is created, the system automatically generates a unique ticket ID and opens a real-time chat so the customer can communicate directly with an L1 support agent. Agents can view all tickets in a dashboard, check issue details and screenshots, reply through chat, and update the ticket status such as Open, In Progress, Resolved, or Closed. The application is built using a Python-based backend with a simple and responsive frontend, focusing on core helpdesk features like ticket tracking, real-time communication, and status updates, and can be extended in the future with more advanced features.
